

Renewable Energy

We find efficiencies throughout your project to achieve your goals as quickly as possible.

Renewable energy projects have a long list of hurdles to overcome before a project is constructed and operational. Regulatory compliance requirements, seasonality restrictions for field investigations, market timing, financial constraints, and community opposition all complicate your path toward project completion. In many situations, you might be spending large percentages of your development budget before you even know if a project is feasible.

At Haley & Aldrich, we understand your need to make the path to project completion as efficient as possible. Our renewable energy consulting team takes an end-in-mind approach to anticipate the environmental and engineering challenges that may emerge throughout the development and construction of your renewable energy projects. The proactive planning strategies developed by our accomplished renewable energy consultants allow us to get ahead of permitting, licensing, engineering, and geotechnical challenges — ultimately preventing schedule delays so you can achieve your goals as quickly as possible.

With decades of experience across the country, our environmental and geotechnical engineering experts work to address your regulatory and engineering challenges thoroughly and thoughtfully. We do this by getting as much

information as possible up front through consultations with you, your stakeholders, and any involved regulatory agencies. This approach allows us to streamline the process, and give you confidence that your project will be completed on schedule.

Designing solutions focused on you and your projects' communities

Our clients often tell us that what sets us apart from other top renewable energy consulting firms is our personal approach. We don't come to you with off-the-shelf solutions. We approach every project as a unique partnership that prioritizes your voice — and the voices of your stakeholders, your community, and the regulatory bodies involved in the process.

At Haley & Aldrich, our renewable energy consulting services team continually seeks to get ahead of project challenges before they arise — and we do so throughout the lifecycle of your project. For example, [during the development of wind projects](#), our staff incorporates project outreach in all levels of our services and understands the need to be sensitive to concerns of the local community and stakeholders. Not only do we take these concerns into consideration when conducting field investigations, but we bring this way of thinking into developing our design and construction recommendations to proactively reduce potential future schedule disruptions.

Some of our renewable energy consulting services include:

- [Environmental due diligence](#)
- [Environmental risk assessment](#)
- [Geotechnical engineering](#)

- [Natural resources](#)
- Permitting and licensing
- [Sustainability](#)
- [Trenchless engineering](#)

Ultimately, our goal is to help your organization make a lasting, positive impact on your community as seamlessly as possible.
