

Industrial and critical minerals

We blend passionate advocacy with collaboration to achieve lasting solutions for industrial and critical minerals developers.

Producers of industrial minerals and critical minerals face more sophisticated permitting, land entitlement, and social licensing requirements — and often lack the in-house resources to effectively address those issues. Operational and financial constraints and complexities due to difficulty locating, developing, and demonstrating the viability of resources are also continually top-of-mind for these developers.

Haley & Aldrich's industrial and critical minerals consultants, including geologists, engineers, hydrologists, and permitting experts, bring decades of experience throughout the entire mining industry. We develop lasting, future-proof solutions through a careful mix of client collaboration, passionate advocacy, active listening, and systems-centric thinking.

As mining industry advocates, we break down complex topics and communicate the positive impacts of your projects for community members, regulators, and legislators. Our consulting team also works closely with your internal technical teams, stakeholders, regulators, and community members so you can meet your goals as efficiently as possible. And we adapt and apply our expertise from other mining segments to ensure you achieve your desired

outcomes.
