

Contaminated site management

We look at contaminated site management challenges through a different lens to deliver technically innovative, future-focused solutions.

The unpredictable nature of contaminated site assessment and cleanup — whether a quick excavation or the start of a multi-year cleanup effort — presents dynamic challenges for your business. A change in regulatory cleanup levels or the discovery of a new contaminant can threaten not only to disrupt your business, but can significantly impact your company's bottom line and damage its reputation if not properly addressed.

Haley & Aldrich's contaminated land consulting experts understand your needs. We partner with academia to develop innovative solutions, hold leadership positions on industry committees and boards, and work closely with regulators. By being at the forefront of research and regulatory knowledge, we can advise you on the most sound and reliable strategy for addressing your contaminated site management challenges, while also helping you understand what's on the horizon and how your business could be impacted.

What also sets us apart is our ability to put ourselves in our clients' shoes, gaining a granular understanding of their needs. As a result, we provide strategic guidance on the nature and extent of your specific contaminated site assessment and cleanup problems, as well as how to remedy them.

Murray Einarson

Service Leader, Contaminated Site Management

Creative, client-focused contaminated site management consulting

Contaminated site assessment and cleanup can be a multi-year commitment that presents countless obstacles along the way. As your advisory partner dedicated to providing unrivaled contaminated land services, the team at Haley & Aldrich works to minimize unexpected hurdles, leveraging a combination of industry expertise and resources that enable us to execute a plan tailored to your project and business goals.

As the field of contaminated site management and cleanup has evolved, we've remained innovative in the way we diagnose and remediate subsurface contamination. Our team has pioneered several new site characterization technologies, cleanup metrics, and methods to diagnose and remediate contaminated sites more efficiently and at a lower cost.

Our contaminated site management consulting services:

- [Coal combustion residuals management](#)
- [Emerging contaminants](#)
